## -- Abstract

10 A device for preventing sedimentation by regulating the flow  
of waste water through drain draining-wells, with or without a  
pump. The device has of a swirl chamber with connected outlet  
pipe and provided with an air injector. The swirl chamber  
which is tapered, generates a vortex flow in which the air  
added by the air injector gives the sludge particles a certain  
amount of buoyancy, making it easier for them to accompany the  
15 water flow without being precipitated.--
